NOVIRANEST

Feature Overview

Food Truck Profit & Pricing System PRO - what every sheet does and how every number is calculated.

The 7 tools

Tool	What you get
Executive Dashboard	Revenue, gross profit, net profit, net margin, monthly operating expenses, COGS, waste, break-even progress; monthly revenue/gross/net chart; where-the-money-goes chart; top-5 best sellers; top-5 most profitable items; 8 alert counters.
Smart Menu Pricing	Ingredient cost per serving (from recipes or override), packaging, prep labour (minutes × rate), other variable cost, total cost, target margin, suggested price (rounded up), profit, actual margin, markup, food cost %, status, recommendation, items sold / revenue / gross profit / sales mix per item.
Recipe Builder	400 ingredient lines. 18 units (g, kg, oz, lb, ml, l, tsp, tbsp, US cup, US/UK fl oz, US/UK pint, US/UK gal, each, dozen, portion). Converts within mass, volume or count; flags mismatches.
Inventory & Waste	100 ingredients: cost per stock unit, opening stock, purchases, automatic usage from sales, other usage, waste, estimated on hand, stock value, reorder alerts. Waste Log valued with unit conversion.
Sales & Expenses	3,000 sales rows and 1,500 expense rows with automatic revenue, COGS, gross profit, cost type and row checks; Monthly Report P&L for 12 months; expenses by category.
Break-Even Calculator	Fixed-cost budget, contribution per item, contribution margin ratio, break-even items / revenue / items per day, target-profit items and revenue, margin of safety, chart.
Event Profit Predictor	Worst / base / best demand, event costs, revenue, contribution, profit, margin, break-even orders and attendance, verdict, actual results from your logs and variance vs forecast.
Scenario Simulator	Baseline month from your data (or override), 5 levers, 9 editable presets, impact table, break-even change, price needed to keep baseline profit, chart.

How the numbers work

Measure	Formula	Notes
Revenue	Σ qty × price charged	Menu price unless a different price is typed on the Sales Log
COGS	Σ qty × (ingredient + packaging + other variable cost per serving)	Standard cost from current Menu Pricing costs; excludes labour
Gross profit / margin	Revenue − COGS; ÷ Revenue	
Waste	Σ waste qty (in stock units) × cost per stock unit	Counted once, as its own line
Operating expenses	Expenses of type Fixed + Labor + Event Fees + Variable	Stock purchases and owner's draw excluded
Net profit / margin	Gross profit − Waste − Operating expenses; ÷ Revenue	Before income tax
Suggested price	Total cost ÷ (1 − target margin), rounded up	Total cost includes prep labour allowance
Margin	(Price − cost) ÷ price	
Markup	(Price − cost) ÷ cost	Cost 4, price 10 → margin 60%, markup 150%
Food cost %	Ingredient cost ÷ price	
Unit conversion	qty × factor(recipe unit) ÷ factor(stock unit)	Only if both units have the same dimension
Stock on hand	Opening + purchased − used by sales − other − waste	Usage and waste counted from the stock-count date
Break-even items	Fixed costs ÷ (price − item cost − price × fee %), rounded up	
Event break-even orders	Fixed event costs ÷ (AOV × (1 − food% − commission% − card%)), rounded up	

Assumptions you should know

- COGS uses the current recipe and packaging costs. If supplier prices change, past months are re-valued at the new cost (standard costing). Export or save a copy at month end if you need frozen history.
- Labour in Menu Pricing is a pricing allowance; actual wages come only from Expenses.
- Inventory usage is theoretical (recipe × items sold). Real usage differs - regular stock counts correct it.
- The Scenario Simulator treats wages, event fees, other operating costs and waste as monthly amounts; price changes do not change volume unless you also move the volume lever.
- Currency setting changes symbols only. No exchange rates are used.
- No taxes (sales tax / VAT, income tax) are calculated. Record sales net of sales tax/VAT for accurate margins.

Technical specifications

Item	Detail
Files	TEMPLATE (empty) and SAMPLE (fictional demo) .xlsx workbooks; 14 worksheets each
Compatibility	Microsoft Excel 2010 or later (Windows/Mac) and Google Sheets. Uses only long-established functions (SUMIFS, INDEX/MATCH, SUMPRODUCT, IFERROR…); no macros, VBA, add-ins, external links or dynamic-array functions.
Capacity	50 menu items · 400 recipe lines · 100 ingredients · 500 waste rows · 3,000 sales rows · 1,500 expense rows
Currencies	USD ($) and GBP (£)
Protection	Dashboard protected without a password (to prevent accidental edits). Other sheets are open.
Testing	Every calculation was recalculated by a spreadsheet engine and compared with independent calculations; edge cases (empty, invalid, zero, negative, unit mismatch) and a full-capacity data set were tested.

Known limitations

- One reporting year at a time (start a new copy each year, or change the reporting year to view another).
- Weight ↔ volume conversions (e.g. grams of flour to cups) need a density and are deliberately not supported - use the same unit type as the stock unit.
- In Google Sheets, money cells show plain numbers (symbol in headers and Dashboard cards).
- Not a bookkeeping, payroll or tax system.
